

Preventative care can be this easy

✓ During pregnancy.

Select a maternity facility that cooperates with eticur): www.eticur.de/klinik. The best way to use our services is online www.eticur.de/auftrag. We send the box by courier 4 – 5 weeks before the expected delivery date.

✓ For the birth in hospital.

Give the collection box to your doctor or your midwife before the baby is delivered. After the umbilical cord is cut, the umbilical cord blood and a small sample of maternal blood are collected.

✓ After the blood has been taken.

The hospital staff instructs the courier to pick up the collection box. The blood is then processed in the stem cell bank and the stem cells are immediately frozen. Extensive quality tests take place in the following weeks.

✓ Personal certificate.

After all the tests have been completed, you will receive a personal storage certificate for your child's stem cell preparation. It will always be available should your child need it one day.

Preventative care with the umbilical cord

Stem cells –
a source of hope for modern medicine

Over
300,000 families
rely on

**EUROPE'S
NO. 1**

Information for pregnant women

Securing stem cells from the umbilical cord!

A unique preventative care measure for your child's future

Why is it so important to store stem cells?

Stem cells from umbilical cord blood are “all-rounders”. They have the ability to develop into almost all cell types of the body. Many diseases can already be treated with stem cells today.

The great benefit: The great benefit: When using the patient's own stem cells, there is no rejection reaction. The body can replace injured tissue and dead or diseased cells with the help of the body's own stem cells. Even siblings can donate stem cells to each other if their tissue is compatible. Collection of stem cells from the umbilical cord blood is simple and completely risk-free for you and your baby.

Think about tomorrow today!
